

ANALOG. DIGITAL. NETWORK.

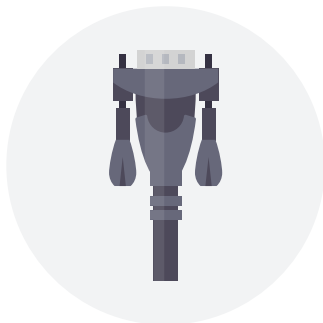

As technology evolves, points of failure increase. Your organization is vulnerable to a 'Single Point of Failure' and needs to carefully evaluate the network as a strategic component of risk management for business operations. Since 2016, our data shows an increase in technology problems unless preventative maintenance is engaged. This does not limit the potential failure, only mitigates the devastation.

CyVig understands the significance of this progression in technology. Before, things just worked; now, the potential for system failure and cyber threat vulnerability is even greater. By engaging a managed security service provider (MSSP), your technology systems are monitored 24/7/365 and unexpected network incidents will be identified as they arise.

70%
of companies
fail at digital
transformation.

- Forbes, 2021

WITH EVOLUTION COMES COMPLEXITY

ANALOG

In another time this was the gold standard. It didn't require a technical manual. Plug this in, turn this dial and things worked. Simple & effective, failure was easy to dissect.

DIGITAL

Advent of the computer, cell phone, and the Internet. Text messaging, voicemail and new functionality pushed us global. Button pushers of new technology emerged. New things to fix.

NETWORK

Networks of people using networks of technology. Connections through millions of transmitters, receivers, encoders, and wires that wrap around the planet.

Protect your workplace technology by securing your environment.
