

FINDING VALUE IN YOUR MSSP

WHAT'S AN MSSP?

A Managed Security Service Provider (MSSP) manages security services for most organizations regardless of size, industry vertical or hybrid complexity. This includes security event monitoring and security device management of an organization's technical environment whether on premise, cloud-based or hybrid including firewalls, systems, data and edge devices.

CISO and security experts know that cyber threats are constantly evolving, and a breach is inevitable. Without proper preparation, the effects of a breach can cripple any size organization. It's no longer a matter of "if," but "when."

Many organizations consider penetration testing or an assessment to help identify weaknesses in their security program. Truth is, unless you have an established cybersecurity program consisting of prevention and detection mechanisms, access management, incident response, risk management, auditability, monitoring, and business continuity planning, these exercises would not benefit or help give you a starting point for your program.

The first step in properly protecting your infrastructure, is to identify the risk and threat landscape and fortify the attack-surface by enhancing your cybersecurity program. Don't take this on yourself; it's critical that you engage the right cybersecurity partner and not just a value-added reseller (VAR).

Like most third-party providers, effectively integrating services from a managed security services provider (MSSP), can enhance the value of your organization's security program and minimize the likelihood of a security incident.

For many companies, the MSSP serves as an alternative to hiring and developing in-house IT security professionals. The ugly truth, however, is that most MSSPs only provide a fraction of what CyVig provides.

STANDARD MSSP

- ✓ One to two person SOC generally outsourced overseas
- ✓ Average technology stack allowing for higher margins on service contracts
- ✓ Overreliance on automated detection processes, AI and machine learning
- ✓ Limited reporting

CYVIG SECURITY SOLUTIONS

- ✓ 24/7/365 U.S.-based SOC with a dedicated "eyes on glass" cybersecurity team
- ✓ Next-Gen Technology Stack (SIEM, XDR, ML-Powered Technologies)
- ✓ Security Program Tuning
- ✓ Detection of Alerts/Intrusions
- ✓ Unified Threat Management – correlating events across the entire attack surface
- ✓ Vulnerability Scanning
- ✓ Analysis and Reporting of Incidents and Network Activities

Take a holistic approach to building your cybersecurity posture.
